RECTANGULAR PHOTOELECTRIC SENSOR

Installation manual - CAT8BFG1260501 - ENG - Created: 01/10/2012

PACK CONTENT

- Installation manual
- ST82 knob regulation accessory for the models with sensitivity adjustment
- N°1 mounting bracket + N°2 screw with bolts and washers
- N°2 mounting brackets + N°4 screws with bolts and washers, only for FGRHD/**.*
- N°1 RL123 reflex, only for FGRN/**.*

GENERAL DESCRIPTION

- Photoelectric switch series characterized by large scanning ranges
- Cable output with revolving connector
- NPN or PNP output (DC models)
- SPDT voltage free relay output (AC models)
- Selectable LO/DO output status
- High detection distances
- Totally protected against electrical damages
- IP 67 protection degree
- Approvals: CE cULus (loghi)
- Background suppression models: 310mm, 600mm
- Photoelectric reflex switch with polarizing filter 12 m
- Through-beam photoelectric switch: 50 m
- Sensitivity adjustment models
- Double Multifunction LED indicator: output state and using the pointing
- Plastic housing

CONNECTIONS AND INSTALLATION

Installation and adjustment:

- Make sure that the supply voltage is correctly settled with a ripple corresponding to the values indicated on the catalogue.
- In case the noise produced by the power lines exceed the values foreseen by the CE norm (interference immunity), separate the sensor cables from both the power and high tension lines, and insert it in a grounding metal raceway. Moreover, it is advisable to connect the sensor directly to the supply source and not to other devices.
- Avoid contact with organic solvents.
- Avoid direct exposition of the receiver to strong light or sun light.
- Use a wet cloth to clean the optic and then dry it.
- To extend the supply and output cables, it is necessary to use a cable having conductors with a minimum size of 1 mm². The maximum length of extension is 100m (this value is referred to a minimum tension and power supply at a load of 100mA).

LEDS FUNCTION

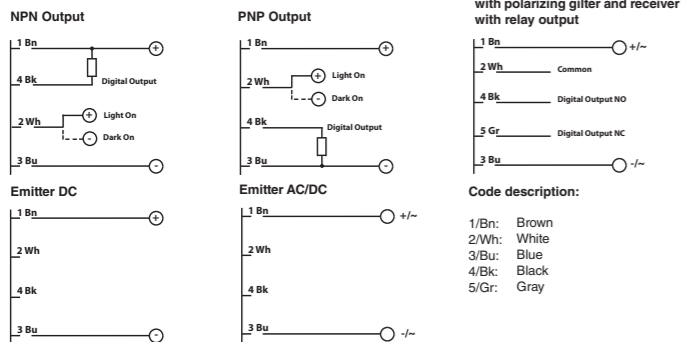

The FG sensor has two LEDs indicators:

- Orange LED: light signal that serves to visually indicate the output state
- Green LED: this light signal is used to signal the ignition of the device and as a visual aid for aiming

- ⁽²⁾ ensure spark extinguishing for inductive or capacitive load
- ⁽³⁾ protection guaranteed only with plug cable well mounted
- ⁽⁴⁾ white target 90% 100x100 mm

ALIGNMENT AND ADJUSTMENT

Direct proximity scanner with background suppression

Mount the unit using the suitable mounting brackets (supplied), connect and align the sensor following the connection diagrams. Place the object to be detected at the required reading distance, checking that the optic axis is perpendicular to the object surface. NOTE In case of reflecting or flat objects, it could be convenient to recline the sensor of some degrees with respect to the perpendicular. Reproducing the worst possible conditions (for example object with dimensions statistically smaller than the usual ones or with parts darkest than the background), place the object as far as possible from the sensor. Adjust light reception setting on Max. the detection distance. Position the object checking that the red beam strikes it. The reception indicator must be permanently switched on, if it switches off or lights, it is necessary to re-adjust the sensor position. If necessary, clean the optic or check the operating conditions. Set the detection distance, remove the object; the reception indicator must switch off (position A=MAX). If not, turn the control knob to Min. until the indicator switches off (e.g. position A). Turn the control knob to Min.. Place the object again. Turn the control knob to Max. until the reception indicator switches on (e.g. position B). If position B < position A, select middle position C. Check overall function. If function is o.k. the setting procedure is over. If the setting is not o.k. check the operating conditions and re-adjust. If position A ≤ position B, background influence is too high.

Photoelectric reflex switch with reflector models

Mount the reflector so that its surface is perpendicular to the sensor optic axis. Check that the distance between the sensor and the reflector does not exceed the values specified for the polarizing filter itself. Fix the sensor safely but not permanently and select the output type. To obtain a perfect alignment, follow the instructions below. Turn the control knob to Max., adjust the sensor by moving it vertically and horizontally until the orange LED permanently switches on (this event advance notice by flashing green LED, in this case green LED is a stability indicator). Permanently fix the sensor and check switches off if you interrupt the beam to the object to be detected. If this happens, you've realized a correct centering on the reflector and a fine sensitivity adjustment of the device.

Emitter / Receiver models

Using the suitable brackets, mount, not permanently, the emitter and receiver according to the detection distance. Place the element strictly on the optic axis. Adjust the emitter moving it vertically and horizontally until the orange LED on the receiver switches on. Adjust the receiver moving it vertically and horizontally until the orange LED remains permanently switched on. Fix definitively the system. The orange LED on the receiver must permanently switch on when the object is absent.

Emitter / Receiver with adjustment models

Using the suitable brackets, mount, not permanently, the emitter and receiver according to the detection distance. Place the element strictly on the optic axis. Check that the position of the sensitivity adjustment trimmer is on Max. Adjust the emitter moving it vertically and horizontally until the orange LED on the receiver switches on. Adjust the receiver moving it vertically and horizontally until the LED remains permanently switched on. Fix definitively the system. The orange LED on the receiver must permanently switch on when the object is absent. Turn the sensitivity adjustment trimmer anticlockwise until the orange LED switches off. Turn the trimmer clockwise until you obtain the permanent switching on of the orange signal LED (this event give advance notice by flashing green LED, in this case green LED is a stability indicator). This position is the optimum one to detect with the same precision both empty or full spaces. If the object to be detected does not present problems, it is possible to turn to the maximum the trimmer and obtain highest performances. The orange LED on the receiver must switch off if you interrupt the light beam.
